Synthesis. Sulfonamides can be prepared in the laboratory in many ways. The classic approach entails the reaction of sulfonyl chlorides with an amine.  $RSO_2Cl + R_2NH \rightarrow RSO_2NR_2 + HCl$ . A base such as pyridine is typically added to absorb the HCl that is generated. Illustrative is the synthesis of sulfonylmethylamide.

Thirty-four novel compounds were synthesized using chesulfamide ( N - (2-trifluoromethyl-4-chlorophenyl)-2-oxocyclohexyl sulfonamide), a high-profile fungicide, as the lead compound, and their structures were characterized by <sup>1</sup>H NMR, <sup>13</sup>C NMR, MS and elemental analysis. Additionally, the structure of ( 1S,2R )-2- ( (3-bromophenethyl)amino)- N - (4-chloro-2-trifluoromethylphenyl)cyclohexane-1-sulfonamide ( IV-9) was confirmed by X-ray single crystal diffraction.

Sulphonamides are bacteriostatic in nature. The sulphonamide sensitive micro-organisms require p-Amino benzoic acid (PABA) for the synthesis of folic acid which is essential for the synthesis of DNA and RNA. Due to structural resemblance of sulphonamides with PABA, sulphonamides competitively inhibit PABA.

A new series of thiazolopyrane 5a-d, 11-13 and thiazolopyranopyrimidine 6-10, 7b, 8b, and 14 derivatives bearing a sulfonamide moiety were designed and synthesized. The molecular design was performed using molecular operating environment software to predict the binding mode of the proposed compounds on hCAII. All the newly synthesized compounds were evaluated for their in vitro anticancer activity against human liver cancer cell line in which hCAII is overexpressed.
